A
Individualized nadir prediction
n = 90; MAE = 1.87; Spearman rho = -0.01
ABC-predicted nadir (visit)
Observed first-rebound nadir (visit)
B
Benefit over the matched baseline
Mean reduction -0.04; patient bootstrap 95% CI [-0.34, 0.24]
Patients
Absolute-error reduction (visits)
C
How often is the prediction close?
Fraction of patients
Absolute prediction error (visits)
Direct ABC
Reference-median predictor
D
Timing bias across the target range
Positive residual = prediction too late; mean bias = -0.10
Prediction minus target (visits)
Observed first-rebound nadir (visit)
