A
Individualized nadir prediction
n = 263; MAE = 2.00; Spearman rho = 0.19
Predicted target time (cycles)
Observed target time (cycles)
B
Benefit over the matched baseline
Mean reduction -0.07; patient bootstrap 95% CI [-0.18, 0.02]
Patients
Absolute-error reduction (cycles)
C
How often is the prediction close?
Fraction of patients
Absolute prediction error (cycles)
Clinical Ridge
Training-fold median
D
Timing bias across the target range
Positive residual = prediction too late; mean bias = 0.01
Prediction minus target (cycles)
Observed target time (cycles)
