A
Individualized nadir prediction
n = 90; MAE = 1.78; Spearman rho = 0.01
Predicted target time (cycles)
Observed target time (cycles)
B
Does clinical correction improve ABC?
Mean reduction 0.10; patient bootstrap 95% CI [-0.04, 0.23]
Patients
Absolute-error reduction (cycles)
C
How often is the prediction close?
Fraction of patients
Absolute prediction error (cycles)
ABC + GP correction
Uncorrected ABC
D
Timing bias across the target range
Positive residual = prediction too late; mean bias = -0.06
Prediction minus target (cycles)
Observed target time (cycles)
